WELL features that are linked to one or more modifiable risk factors (MRFs) from the Global Burden of Disease Study (GBD) are ordinarily ranked from 1 to 42. The rankings are based on the number of disability-adjusted life years (DALYs) due to modifiable risk factors (MRFs) that a feature may be able to address in some way if it were implemented in a project located in Italy.

It is important to note that some features may be linked to the same MRF(s) that other features are also linked to, but the MRFs linked to a single feature are not double-counted if two or more parts are linked to the same MRF.

Features that are not associated with any MRFs in the GBD are not ranked and are shown as "N/A". It does not mean that they are not associated with health or well-being, or that they are not important. They simply are not linked to any currently existing MRF(s) in the GBD database. The database is regularly updated and as more risk factors are added, more linkages between risk factors and WELL features may be made in the future. See the Italy Country Brief for more information.
